Townlight Records — specification and current source map

Townlight Beta 1 component (AGPL-3.0-only): `townlight-records` 1.8.0.dev2, principal import `townlight_records`, paired with `townlight-core` 1.3.0.dev2. Windows MSI 1.7.0.1 is published. Its exact acceptance summary is at https://github.com/townlight/townlight/releases/download/townlight-beta-1-windows-1.7.0.1/ACCEPTANCE-Windows-1.7.0.1.md; standalone deployment remains separate.

The complete retained design specification preserves its original text, identities, phase labels and dated release/test claims. This index does not remove its product requirements. Those implementation and completion labels describe the recorded versions; they are not proof for this changed candidate. The approved naming/fresh-install decisions supersede its old distribution, import and upgrade assumptions.

Use the current operating manual for the bounded Windows workflow and its deployment limits. The current API reference and generated OpenAPI schema describe the current source routes; the source inventory identifies the inspected files. The README provides exact local-wheel installation instructions.

The native Windows product and the standalone Compose deployment have different installation paths. The coordinated Windows MSI uses the native runtime, a fresh empty database/profile and the approved existing profile-directory spelling. There is no in-place legacy database upgrade or old-import compatibility shim. Historical Inno installers and their original receipts are not renamed.
